Errors/bugs: Maybe Faced

Problem: If you are facing some issues in updating the user's profile or something else, then you can rectify the errors/bugs using these:

1. Are you putting the authentication check at the router level?
2. The editor does not show some syntax errors like missing closing brackets.
3. Check for typos in the controller.
4. Match action of the form to URL in the router.
5. Match controller function being called in the router to the function name in the controller.js file
6. You can check your code files in this manner:
   EJS → router → controller → schema (to cross verify if the properties you are accessing have the same name as defined in the schema))
7. Take a break and come back to the situation with a fresh mind :)
